LEARNING DIARY

8.8.2026

I read through Moodle pages to get idea what the course holds in it. After that I setup my VS code with recommended extensions to make working with coursework and project easier. Later I watched through the coursework example project and started working along with it. Most of the stuff that was presented in the first half of the video was something I was already familiar with. I did learn about the use of variables in css file which I had not previously done. I did also learn how to use css more efficiently. Also learned that i could use classes such as text-md to make formatting easier so that I did not need to do it separately each time. Previously I had only used css on small projects and even then, not very extensively.

17.8.2026

I've continued watching the video and kept implementing new features to the example project as the video progresses. I learned about the use of media queries and the use of grids in CSS. I also learned more about adding

21.8.2026

I've started the course project and already almost finished it. My idea for the project was to great similar page as the example project, but my page features my favourite albums. I did not add that much content on my page since the objective was to create responsive page with navigation and use the flexbox and CSS grid. I have 4 sections in my page: hero, album-of-the-month, favourite-albums and playlist. Hero includes just short introduction to the page and then some filler lorem ipsum. Album-of-the-month has the most listened album during the month and short description of it. Favourite-albums has collections of all-time favourite albums. Playlist section has an example playlist that I put together using embedded Spotify link. Today I completed most of the page. I made the page responsive in desktop and mobile. I added all the sections and made the CSS for them as well. I utilized the example projects CSS but modified it to my liking and so that it functions with my design. Next, I need to finalize the page and deploy it.

2.9.2026

I did last check ups for the project and did some minor adjustments to the page. I had to adjust the image sizing on my page on mobile since it was a bit off. Also needed to adjust texts so they would wrap instead of overflow through their containers. I've recorded the page working both in desktop mode and mobile mode to show that page remains responsive despite the screen size changing. For the last I have deployed the page and now my course is ready to be evaluated.
